THE GROWING OF ANTHRACENE SINGLE
CRYSTALS, [1962] 4p. 7 refs.

Order from SLA \$1.60

62-10686

Trans. of Kyoto Kagaku Zasshi (Japan), 1961, v. 64,
no. 7, p. 1218-1221.

DESCRIPTORS: Anthracenes, Single crystals.
Crystallization, Semichalcogen compounds.

The growing of single crystals of 2, 5 cm diameter
and height, in a millimeter for radiation measurement,
was attempted. The Bridgman method of growing
spontaneously with a capillary tube was unsuitable
for substances such as anthracene, whose inter-
molecular force is weak and which is markedly anisotropic.
By one method, a crystal tube only for seed
of about 1 mm diameter, was prepared separately.

Trans. of Nihon Gomu Kyokaiishi (Japan) 1958, v. 31,
p. 961-965.

DESCRIPTORS: *Rubber. *Abrasion. *Test methods.

When conducting an abrasion test on rubber, three factors, namely, the coefficient of friction, load, and slip velocity should be considered as primary factors. Abrasion tests were conducted at different loads and slip velocities with a newly manufactured abrasion tester which is capable of measuring power and changing speed. It was found from the test results that, when load and abrasive are constant, the relationship between slip velocity change and wear tendency can be represented by a line $A_L/P = KV^n$, where A_L is abrasion loss; P is power; V is slip velocity; and K, n are (Materials--Rubber. TT, v. 6, no. 3) (over)
